Meeting assets for MANULIFE custom onboarding PANW are ready!

Meeting summary

Quick recap

The meeting focused on planning the migration from Prisma Cloud to Cortex Cloud, specifically discussing the choice between CloudScan and Outpost deployment models. The Manulife team, led by Philip, sought clarity on capabilities, limitations, and support for private endpoints and registries in both models. Avishai and Gil from Palo Alto Networks explained that CloudScan supports private ACRs and JFrog Artifactory scanning, while Outpost is mandatory for AISPM capabilities. The team decided to start with CloudScan for initial testing to achieve parity with existing Prisma Cloud functionality, while exploring Outpost for Azure at a later stage. They discussed the need for a dedicated subscription for Outpost in production and the potential cost implications of testing in a shared subscription. The conversation ended with plans to proceed with CloudScan onboarding and to involve Professional Services for technical guidance.

Next steps

- John: Request the global role to be created across the tenant and assign it to the Cortex Cloud enterprise app for CloudScan onboarding.
- ulloaju: Consult internally with the FinOps team regarding cost limits and budget implications for the outpost deployment in the existing engineering subscription.
- Avishai: Double-check with engineering about any limitations or dependencies for scanning private ACRs and AISPM dependency on Agentless Disk Scanning (ADS).
- Gil & Avishai: Double-check with engineering about the permissions required for JFrog Artifactory scanning in Cortex Cloud.
- ulloaju: Obtain the architecture diagram for the existing Event Hub solution from the 2V team (Patrick's team) to clarify audit log ingestion.
- Avishai: Provide clarification on whether multiple Event Hubs are supported for audit log ingestion.
- Ron: Reach out to Philip to schedule a PS kickoff and technical review session once Manulife is ready to start the onboarding.
- Lisa: Send a meeting summary and next steps formally via email.
- Avishai & Lisa: Coordinate with the KSPM product manager (once available) to address John's question regarding AI/asset discovery for the next session.

Summary

Onboarding Process Planning Meeting

The meeting began with participants joining and discussing technical differences between Teams and Zoom platforms. Philip outlined the meeting's objective, which was to address questions about a previously shared document and establish an action plan for onboarding, with the goal of leaving the meeting with no outstanding questions and a clear timeline for starting the onboarding process.

Regional Outpost Subscription Consolidation

The team discussed the possibility of creating one outpost per region, which could be managed within a single subscription rather than across multiple subscriptions. John noted that this consolidation would help address previous concerns about infrastructure deployment across 700+ subscriptions. Avishai clarified that private ACRs and most other capabilities are actually supported in the CloudScan model, with the main difference being Dspm capabilities and some Azure-specific features that are only available in the Outpost model.

Private ACR Scanning Support Discussion

The team discussed the support for scanning private Azure container registries (ACR) using CloudScan and Outpost platforms. Kowsi clarified that cloud-based registries could be supported by CloudScan, while on-premises registries would require a broker VM or Outpost model. Avishai, a senior product manager for Cortex Cloud's cloud worker protection, explained that scanning private ACRs should not have limitations, with the process happening through private endpoints and service principal trust mechanisms between subscriptions.

Cloud Outpost Implementation Discussion

The team discussed implementing the Outpost model for cloud deployment, with Philip asking about the recommendation from Paulo. John raised concerns about complexity, noting that multiple Azure accounts and other cloud providers (AWS, AlleyCloud, OCI, and Google Cloud) would require separate Outposts. The discussion revealed that the team currently doesn't have dedicated Prisma subscriptions in their primary Azure tenant or in other cloud providers, though they do have general engineering subscriptions in their primary tenant.

OCI Implementation Strategy Discussion

The team discussed the implementation approach for OCI support, which requires creating outposts for each cloud provider (Azure, AWS, GCP). Philip proposed using a mixed approach where they would implement Azure outposts for their main cloud work and deep discovery, while using Cloud Scan for AWS and GCP due to limited activity on those platforms. Avishai confirmed that mixing different approaches within the same onboarding is possible, allowing them to onboard AISPM-related subscriptions to Azure outposts while using Cloud Scan for other workloads.

Outpost Subscription Requirements Discussion

The team discussed subscription requirements for deploying an Outpost, with Gil and Avishai explaining that while a general cloud engineering subscription could technically support testing, it's not recommended due to potential resource conflicts and API limits. Avishai emphasized that production Outposts require dedicated subscriptions to ensure proper performance and scalability, as shared subscriptions could lead to resource exhaustion and scanning delays. John indicated that obtaining a dedicated subscription for testing purposes would require a formal request process, though he noted it wouldn't be a significant blocker.

TSPM and ADS Dependencies Discussion

The team discussed dependencies between TSPM, AISPM, and agentless disk scanning (ADS). Avishai agreed to verify the specific dependencies between AISPM and ADS, as this information wasn't clearly documented. Gil suggested conducting lab tests with ADS to evaluate its effectiveness and understand the product's holistic functionality, noting that while ADS may be used as a mechanism for some DSPM capabilities, it doesn't need to run continuously across the entire environment.

Outpost Deployment Subscription Discussion

The team discussed concerns about using an existing engineering subscription for Outpost deployment, with Julio indicating they would need to consult with the FinOps team about subscription limits and budget implications. John raised questions about Azure policy compliance and resource spinning up, while Gil explained that Terraform templates would adapt based on selected services and Outposts would only incur minimal costs when actively scanning. The discussion concluded with Gil asking if they could start with CloudScan as a trial approach.

Cloud Migration Model Selection

The team decided to proceed with the CloudScan model for Cortex Cloud migration as a starting point, with plans to later evaluate the Outpost model for specific capabilities like AISPM. Avishai confirmed that private ACL scanning is available for both CloudScan and Outpost, and explained that JFrog Artifactory scanning can be configured with static IP addresses for network access control. The Manulife team identified several action items including requesting global role creation across their tenant and subscription-level permissions, while the Palo Alto team will provide PS consultant support and schedule formal kickoff sessions for the onboarding process.

Attendees: Lisa Toukmanian (Organizer), Ron Doria, John Tan (External), ahmafar (External), ulloaju (External), Ajay Devjani (External), Pradeepan Gunabalasingam, Meysam Alaghebandha (External), Udayakumar Desai, Michael Lei (External), Philip (External), Luis Latorre, Davika (External), Avishai Moshka, Gil Kedem, Ali Khalighi, Kowsi Murugapoopathy
